Advisense
Forward Deployed AI Engineering Intern
Stockholm

Dear Hiring Team,

I'm applying for the Forward Deployed AI Engineering Internship in Stockholm. I'm currently pursuing a Master's degree in AI and Language at Stockholm University, and this role appeals to me because it combines two things I enjoy: building software end-to-end and using AI tools to do it well, not just quickly.

I've worked across the stack on my own projects, building a REST API and React frontend for a custom database system, and maintaining Hippo Codes on my own, including its CI/CD pipeline. During an internship at IBM Research, I built a custom LangChain component integrating LLaMA, DeepSeek, and Granite models, which gave me practical, hands-on experience working with LLMs rather than just reading about them. Most recently, as a Data Engineer at Bosch Research, I've been building Python and Spark pipelines that process tens of billions of records in production.

What draws me to Advisense is the chance to work on software real financial institutions use, alongside experienced engineers, while learning to use AI tools responsibly as part of that work. I'm comfortable picking up new stacks and domains, and I'd welcome the opportunity to talk more about the role.

Best regards,
Leonard Eckert
